# The Electronic Eavesdropping Threat

In this information age it is not surprising that an organisation's most valuable asset, its information, is under the greatest threat of being stolen.

Industrial espionage is commonplace: with over 200,000 electronic eavesdropping devices and covert cameras being sold in the UK alone each year, many companies will suffer loss of profit, whether they realise it or not.

What is surprising is the lack of concern and action amongst many companies to prevent such intellectual loss. Most people believe it is unlikely that anyone would want to listen in to their conversations, and even if they did, they would gain little from doing so.

However, if a sensitive document was to fall in to the wrong hands there would be considerable concern, yet discussing the contents of such a document in a meeting is not considered to be a security threat. An eavesdropper is given access to sensitive information from a secure document just by listening to the conversation.

## The Solution

DETECTIV is a revolution in the detection of electronic eavesdropping devices, commonly known as bugs. For the first time four key methods of detection have been integrated into one easy to use unit. Designed to provide anyone with the ability to detect and locate electronic eavesdropping devices.

Just as protecting your computer requires action against various threats such as viruses and hacking, different types of electronic eavesdropping device require different methods of detection. Until now this has meant using several different types of equipment, each specialising in a particular threat.

Integrating four main detection methods, DETECTIV provides the most comprehensive search tool available. As well as addressing the various

eavesdropping threats the different sensors also work together to enhance the search capability providing a more complete picture of the search environment. Much as we humans use all our senses in unison when searching for an object, all of DETECTIV's sensors combine to allow more accurate judgement about a detected device.

For example, searching for a ringing phone. Although we are initially alerted by the sound of the phone we ultimately locate the phone using sight. Using both sight and sound speeds up the process of locating the phone, whereas using only one of the senses, you may miss the phone call altogether or take much longer to locate the phone.

# DETECTIV

DETECTIV's multi-sensor information is displayed in a simple straightforward manner allowing the user to quickly and easily **detect** any suspicious readings. Further screens are available for each of the sensors that allow the user to **identify** if the reading is a threat and, once verified the user can use the **locate** mode to pinpoint the target.

Light and portable with an excellent battery life, DETECTIV is easily transported and can be used with minimal training and is the ideal tool for securing today's business meeting.

- Simplified presentation of complex information
- User-friendly touch-screen controls, providing clear indication of target

## Fast, Light, Easy to use...

### User Benefits

- Designed for non-technical users to conduct effective and thorough searches
- Integrated use of sensors optimises detection of suspicious devices
- User-friendly touch-screen controls
- Clear indication of targets
- Simultaneous sensor sweep significantly reduces search times
- Cost-effective solution for bug detection
- Ergonomic light-weight design for comfortable operation
- Compact for easy transportation

### Technical Summary

- 10 MHz to 10 GHz; covers all radio bands now used
- Optimised sensitivity for localised searching
- Battery operation greater than 2 hours
- Extendable head: 1 metre
- 5 updates per second, real time information

making it safe to talk

# After Sales Support

DETECTIV comes with a warranty against defective materials and workmanship for a period of two years from delivery. With regular authorised maintenance and recalibration of the unit, the basic warranty can be extended for a further period, ensuring maximum benefit and continued high performance from your product. Our Technical Support Unit is always on hand to provide advice and support in the use of all of our products.

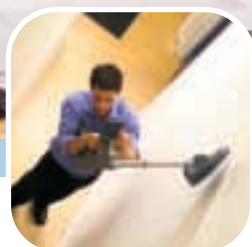

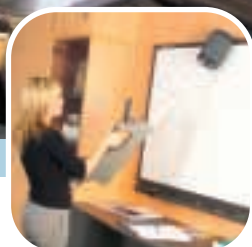

## Training

Audiotel International is able to offer full training in the operation of our products together with general countermeasures training and seminars.

## Audiotel International

Audiotel International provides commercial de-bugging solutions which demystify electronic countermeasures and give practical advice on how to raise the level of in-house security against the bugging threat.

Audiotel is committed to long-term development of customer-led products and services. We believe in forming strong long-lasting relationships with our customers and have a long list of satisfied blue chip clients. The needs and aspirations of our customers drive Audiotel's vision of the future. We will continue to design and create new products and assist organisations globally to protect the spoken word.
